

# Drift Dynamics

From the traffic radar to the  
assessment of the "wow factor"

# What is the purpose of Drift Dynamics?

In drift, it is not speed that is evaluated, but completely different parameters - the angle of skid, the trajectory of the car and the style of piloting. Common telemetry systems are not suitable here, and therefore the Russian Drift Series has developed its own Drift Dynamics complex. There are no analogues in any country in the world! We tell you how the system works and what it is capable of.

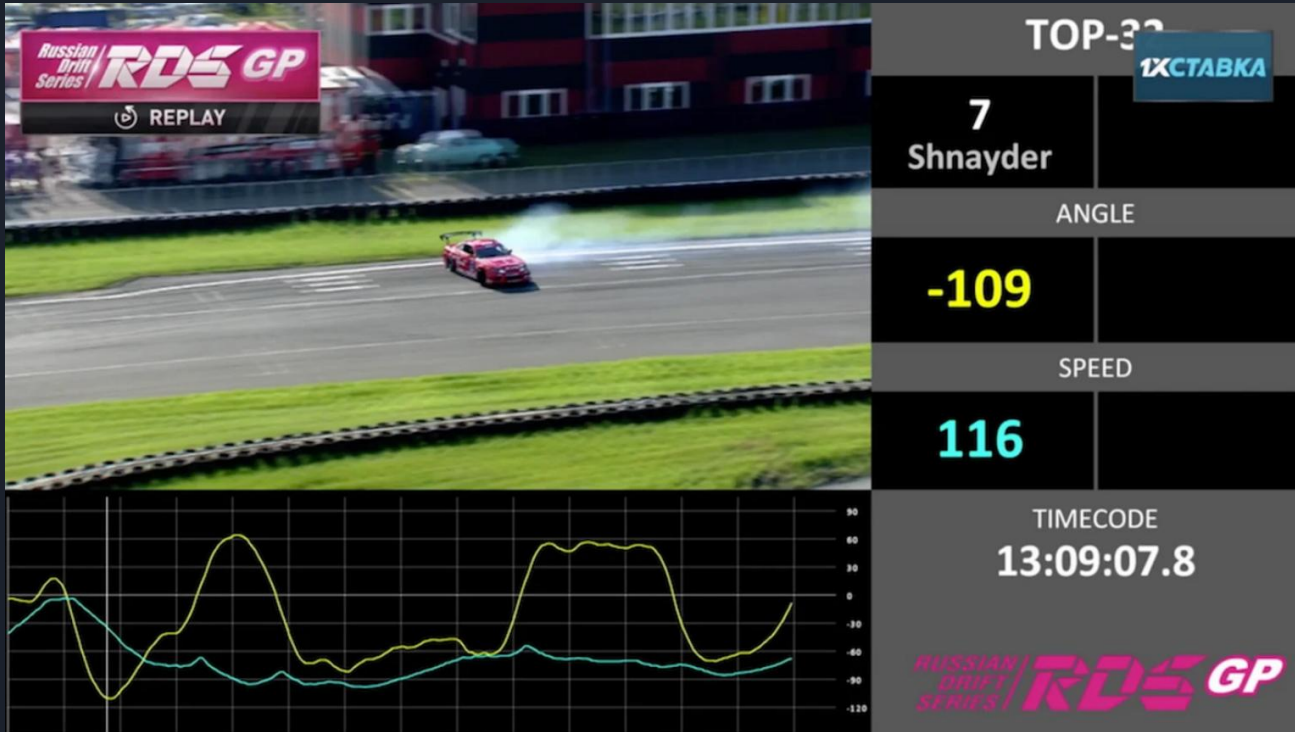

# Suction cup, sensor, server and artificial intelligence

In the process of work - from the start to the finish line - the sensor collects data and transmits it via the radio channel to the base station, where the information is processed, transcoded into the specified format and sent to the server.

This is how Drift Dynamics data looks like in the RDS GP broadcast

Exclusive, which is not available in Japan and the USA

Drift Dynamics is an exclusive development of Russian drift
